business intelligence

for

Oracle E-Business Suite

No programming needed

Simple configurations

Intuitive and easy to use

Designed for Business Users

400+ Configurable Templates

Scalable Data Management

Enterprise Quality

Data Cleansing

Benchmarked for multi-million records in a single load

Extensive Audits

Secure

Also available in SaaS, Cloud

The return on investment provided through use of the appload application easily justified the cost of the product. We have identified uses that impact all business areas within EBS.

--- Lifeway Christian Resources

The appLOAD tool helped us tremendously in reducing our project time lines for converting large amounts of data from various legacy systems into Oracle.

--- Hypercom

appLOAD is a new generation data conversion tool for Oracle E-Business Suite 11i/R12. The tool significantly reduces project timelines and cuts costs. Extremely useful during implementation/reimplementation and for routine production data maintenance. Very easy to use and does not need programming. Supports all open interfaces and APIs.

All APIs and Open Interfaces of Oracle E-Business Suite are supported.

Provides powerful pre-validation checks. System shows clear warnings and errors. Most errors and warnings provided before hitting the Oracle EBS database.

Accepts input from Excel, XML, flat files and databases.

Hub and Spoke Model: One appLOAD instance connects and loads into multiple EBS instances.

Data Translations using change case, to-date, to-char, decode and SQL
Conditional Data Translations using results of SQL queries.

Data cleansing, consolidation, harmonization.

Oracle errors are consolidated from different places into which Oracle writes them and are shown against the input row that caused the error. Separate info (files) are provided for processed data, un-processed data and erroneous data after data load process is completed.

appLOAD offers easy drag and drop data mapping between the input data source and the open interface table columns and API parameters. Additional column mapping can be done over and above the standard templates.

You and your people have been able to create templates for an area of Oracle which had never before been touched and updated in such a rapid time.

--- Teknion

Boart Longyear is a happy user of the appLOAD product and pleased to work with Chain-Sys as a company. appLOAD and Chain-Sys fill an important niche in the Oracle tools market that we could not find anywhere else.
